

## **Technical data**

recillical data						
operating voltage	24V AC/DC±10 %					
power consumption FGO						
power consumption FGS<15 mA						
weight						
contacting connecting terminals on the housing						
Type FGO 2.K/5						
measuring range (010 V)						
accuracy (MR 5095%rh, at 23	3°C) ±2%rh					
output signal	010V					
response time (at calm air)	< 20 s					
Type FGS 02.K/5						
break point (factory setting)						
"off" (contact "open")	≥96 ± 2%rh					
"on"	"off"-4%rh ±1%rh					
output						
voltage	max. 48V					
switching current	max. 0.5A					
switching power	max. 10W					
Type FGS 02.K/6						
break point (factory setting)						
"on" (contact "closed)	≥90 ± 2%rh					
	"on"-4%rh ±1%rh					
output	floating contact					
voltage	max. 48V					
	max. 0.5A					
	max. 10W					
Temperature application range	FGO20+80°C					
	FGS 0+70°C					

applied directives / standards low-voltage directive 2014/35/EU EMC directive 2014/30/EU DIN EN 60730-1:2012-10 DIN EN 60730-2-13:2008-09

## **Humidity sensors for condensation control**

- analogue output signal

Type FGO 2.K/5

- switching output (break contact) Type FGS 02.K/5 - switching output (make contact) Type FGS 02.K/6

Dew-point control sensors are mounted on cooling water pipes or on cooled surfaces and are used to monitor if the temperature drops below the dew-point.

They measure the relative humidity directly on the surface of the cooled part of the equipment and can, therefore, be used

- to influence cooling power
- to switch cooling systems on or off
- to signal the point at which the temperature drops below the dew-point.

This means that cooling ceilings, for example, can be operated with perfect results, even at critical climatic values, without condensation starting to form.

### **User instructions**

The sensors are to be mounted in the place where condensation is most likely to form, on the polished metal pipe using cable binders or on a smooth surface which must be clear of grease and be dry using the ZA 30-type mounting kit which is available as an accessory.

Ensure that there is good thermal contact between the pipe or the surface and the humidity sensor.

The installation position is to be selected in such a way that a representative measurement of the air humidity will be given. i.e. the ambient air must be able to reach the measuring element within the casing without obstacles. The condensation controler should be exposed to the flow of air.

The sensors come ready-calibrated and, consequently, do not need to be adjusted on-site.

Please consult the application instructions for the sensing elements (product info sheet no. A 1) or check with the manufacturer for further information which you need to bear in mind when using humidity sensors with capacitive sensing elements.

### Type Survey

Туре	FGSO2.K/5	FGSO2.K/6	FGO2.K/5
Order no.	42FGSO2.K/5	42FGSO2.K/6	45FGO2.K/5

ATTENTION! Sensors FG02.K/5 have no galvanical separation between output and operating voltage at the negative pole. Please pay attention to this fact when connecting an AC operating voltage.
